Ultrasound in gynecological laparoscopic surgery
Bari (Italy) June 4-7 2008

2000 – 2008 statistics

8000 interventional laparoscopies

- 1300 total laparoscopic hysterectomies (TLH)**
- 400 subtotal laparoscopic hysterectomies (SLH)**
- 2700 laparoscopic myomectomies**
- 140 laparoscopic lymphonodectomies**
- severe endometriosis, surgery of adnexa**

... and all this was done with ultrasound technique !

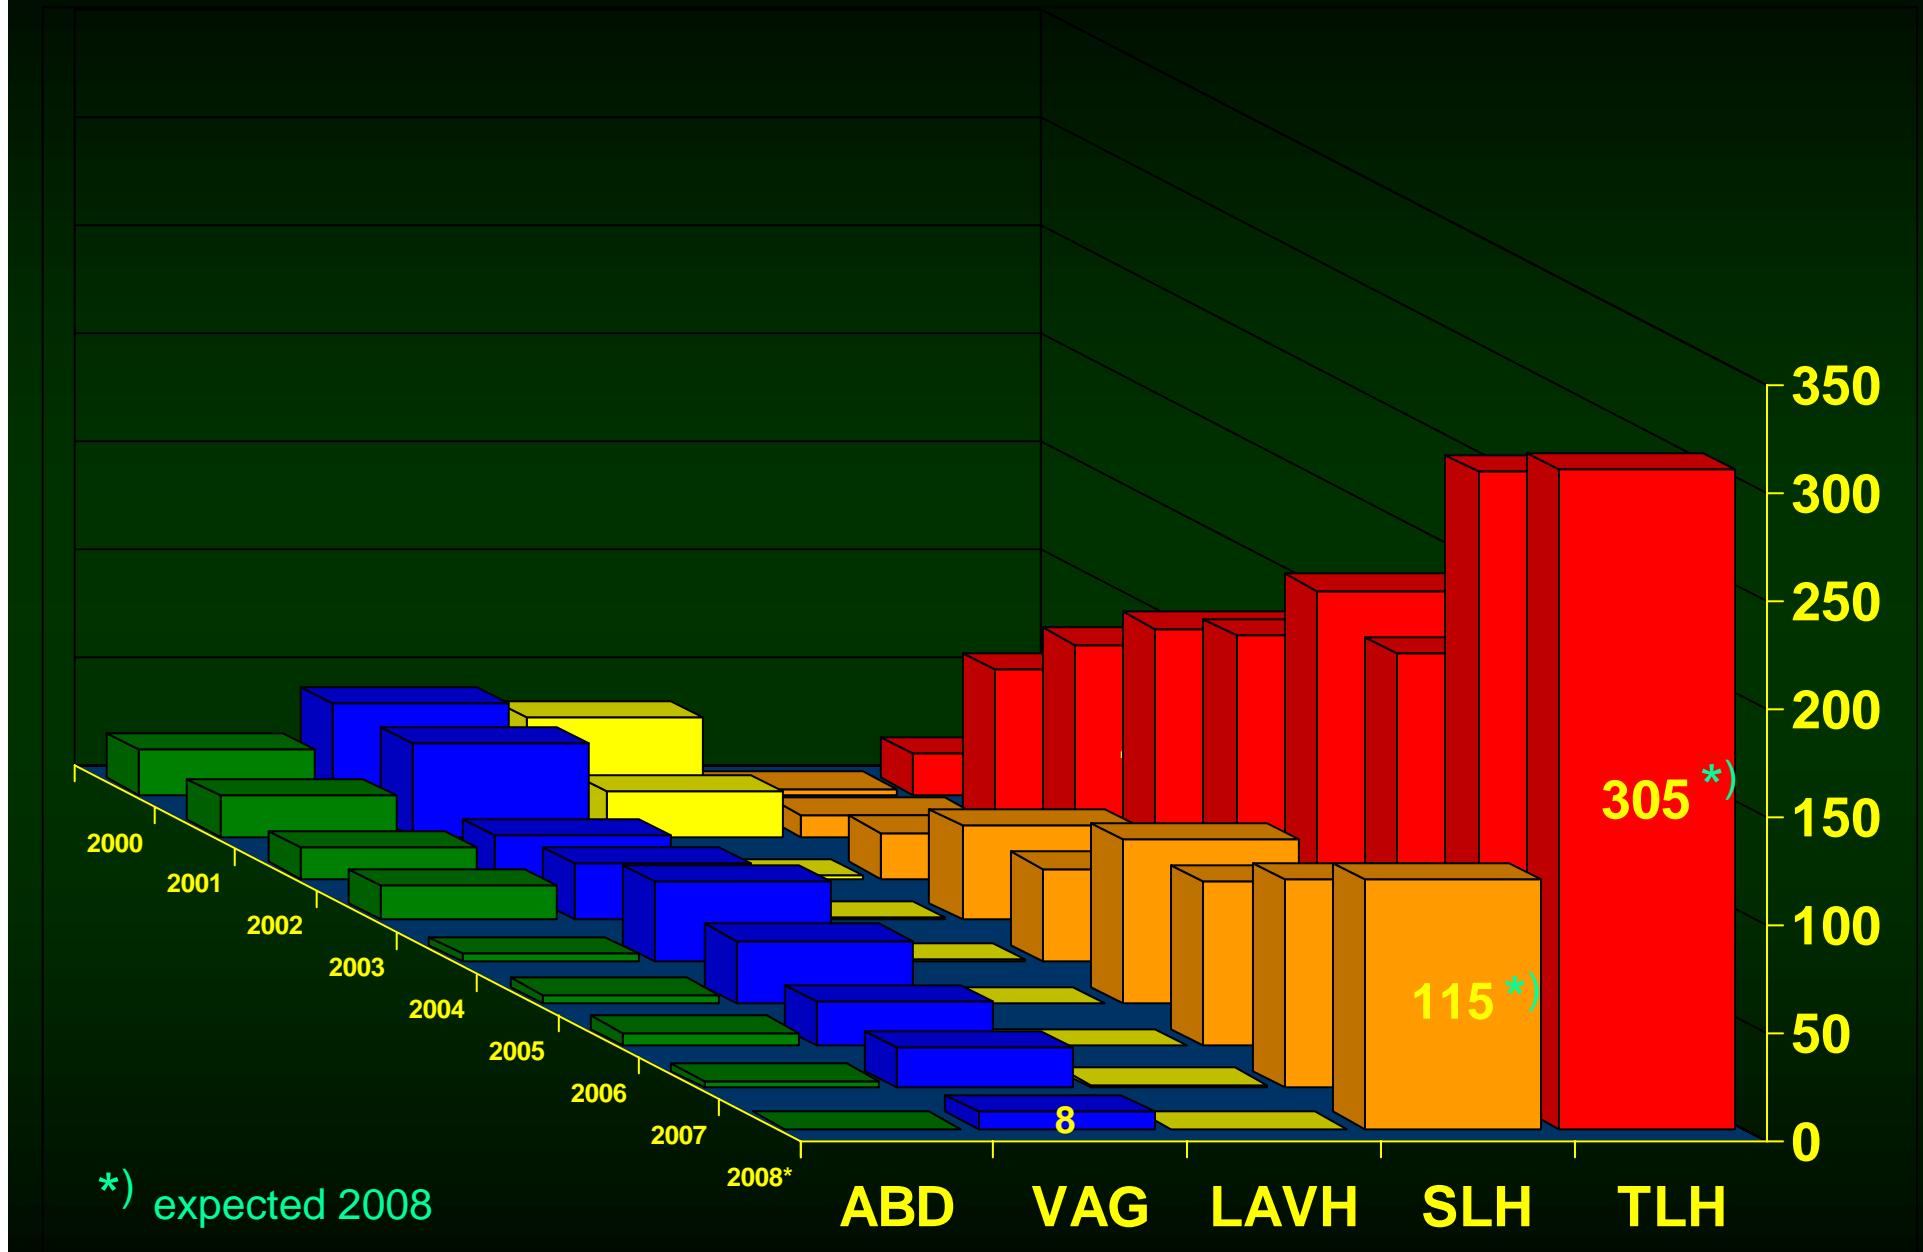

***) we are minimal access surgery ...**

Ultrasound in gynecological laparoscopic surgery
Bari (Italy) June 4-7 2008

Surgical access for hysterectomy 2000-2008 (n=1869)

*) expected 2008

Advantages and disadvantages of ultrasound techniques

Advantages:

- Multifunktional instrument (cutting, cavitation and coagulation)
- precise dissection
- small necrosis zones
- no secondary lesions (cautery)

Disadvantages:

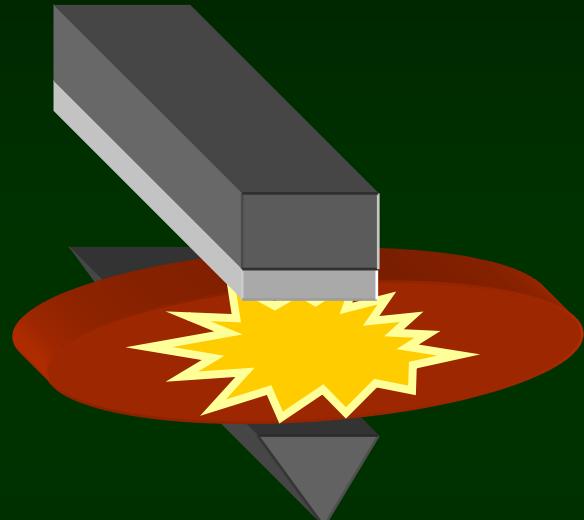

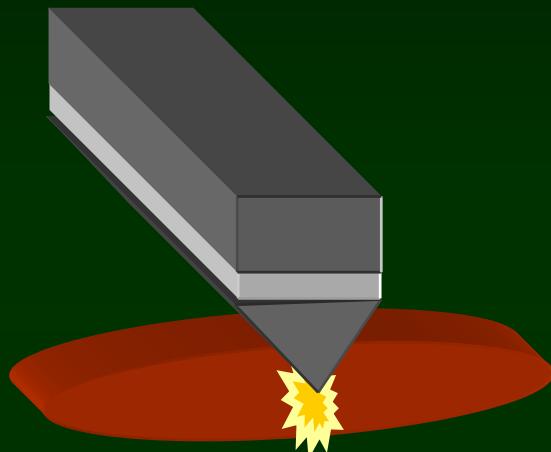

- high costs (single use)
- long learning curve
- relatively „slow“
- disappointing coagulation of big vessels

The 2 (3) effects of ultrasound dissection

Cutting

Coagulation

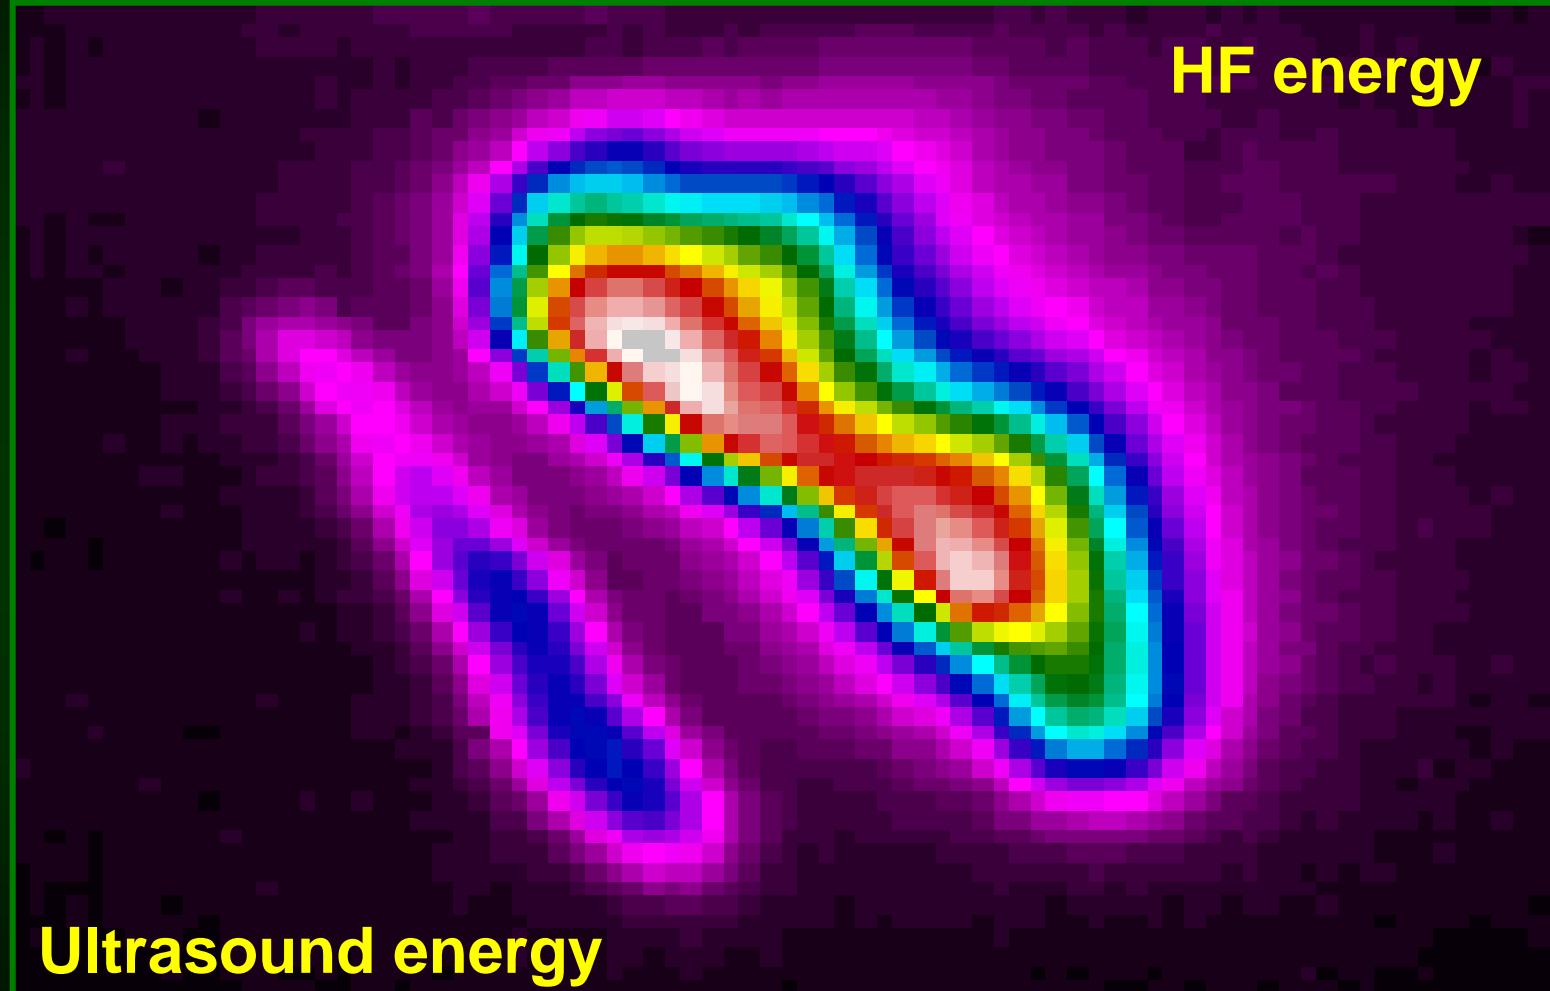

Superficial
Coagulation
with the
tip

- ↑ Power (Level 5)
- ↑ Dissection speed
- ↑ Tension of tissue
- ↖ Sharp side

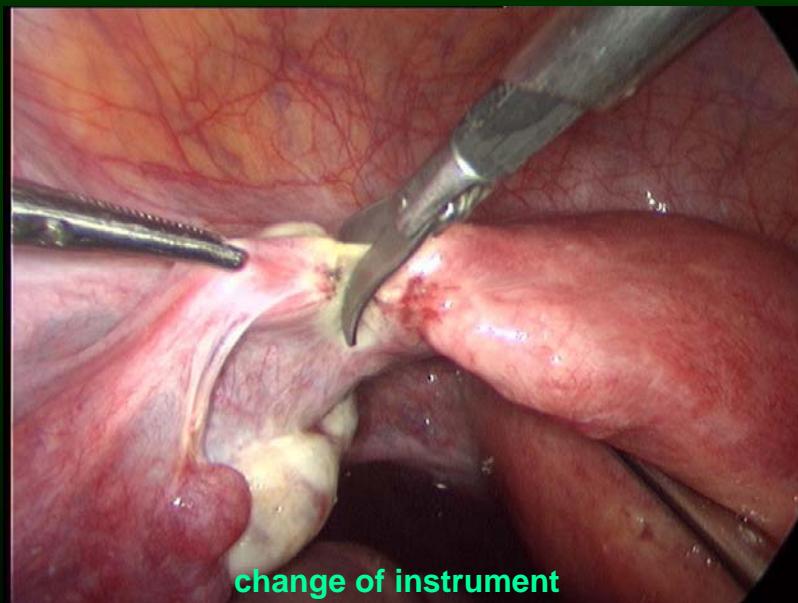

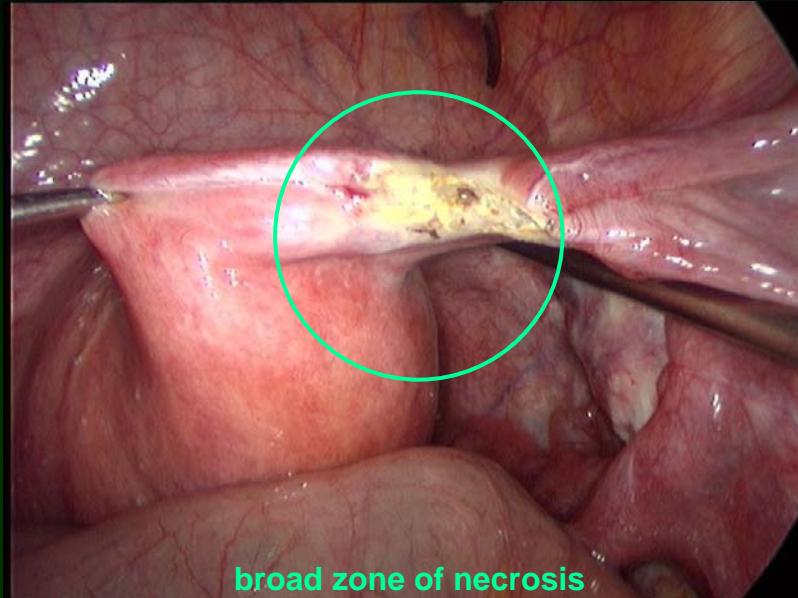

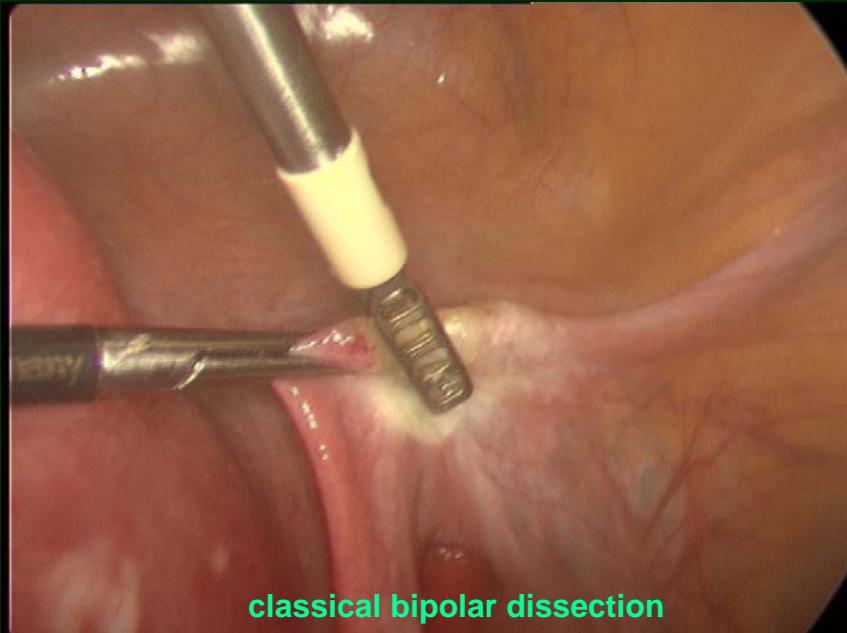

- ↓ Power (Level 3)
- ↓ Dissection speed
- ↓ Tension of tissue
- ↙ Flat side

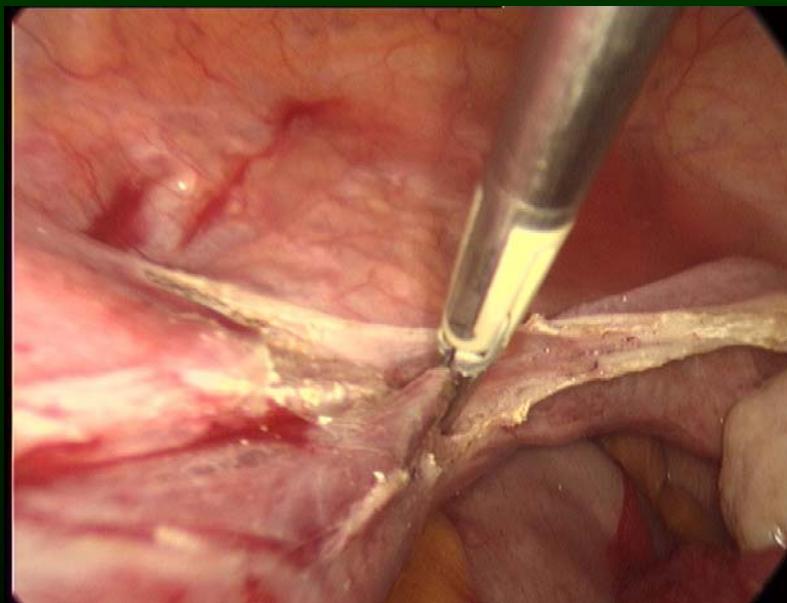

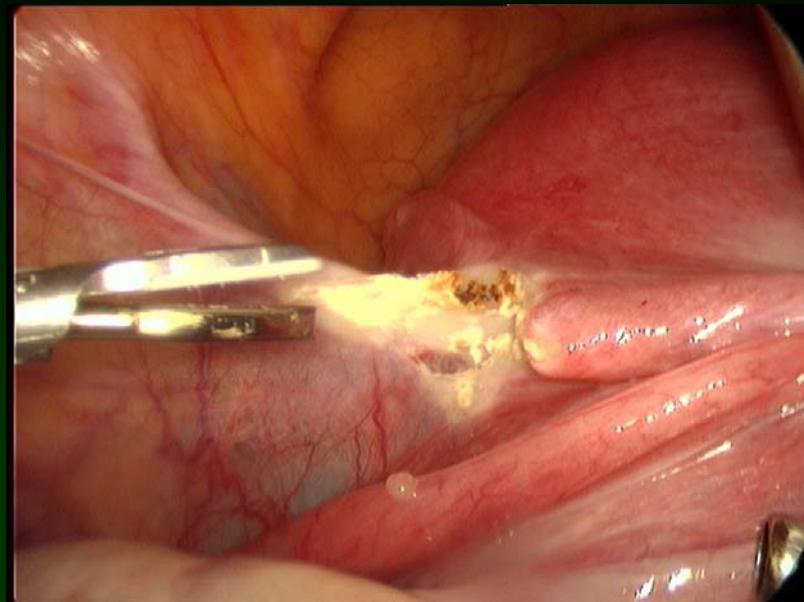

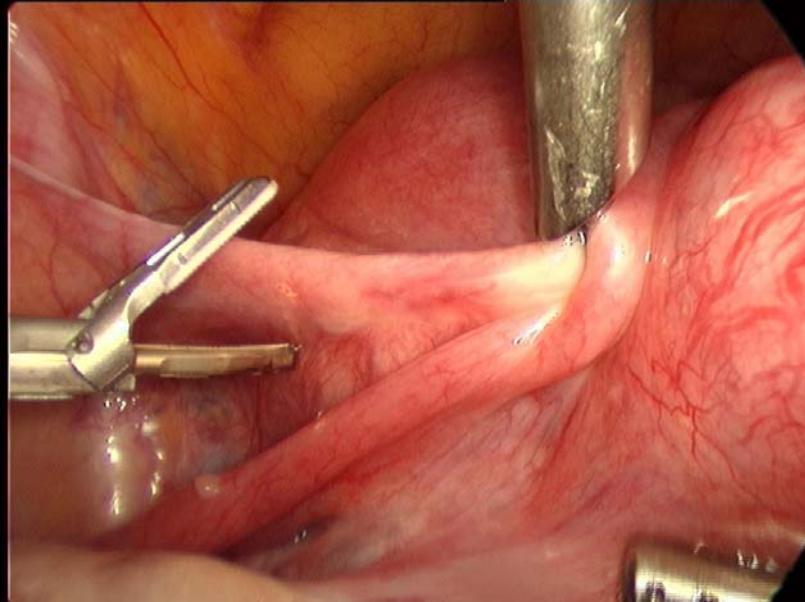

Ultrasound vs. HF

Bari (Italy) June 4-7 2008

We must be aware of the fact that:

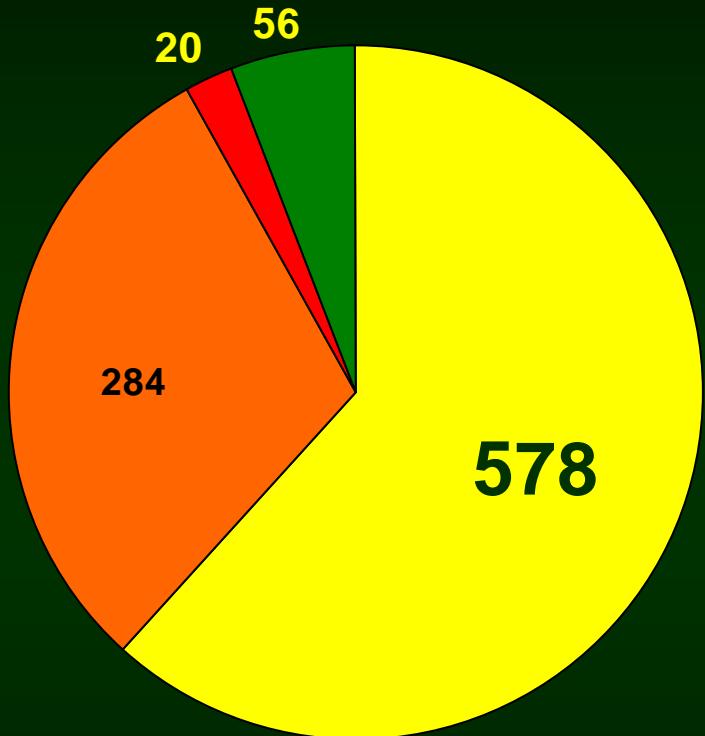

**Total laparoscopic hysterectomy is impossible
to perform without
modern dissection techniques
(i.e. preparation and coagulation)!**

**So what is the best operating technique ?
bipolar, ultrasound ?**

Laparoscopic total hysterectomy

study design (1)

December 2005 to May 2008

944 hysterectomies

- TLH (Total Laparoscopic Hysterectomy)
- SLH (Subtotal Laparoscopic Hystrectomy)
- ABD (Abdominal Hysterectomy)
- VAG (Vaginal Hysterectomy)

Laparoscopic Hysterectomies

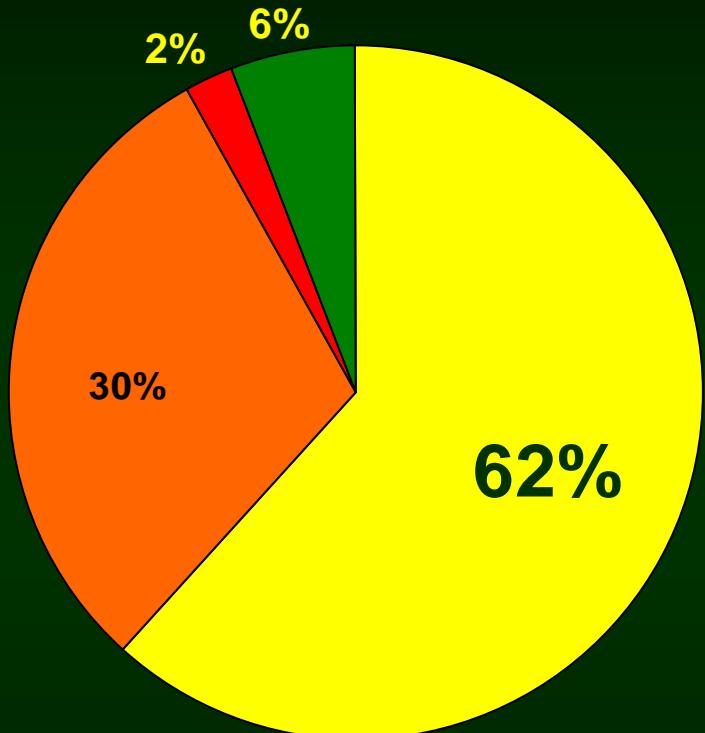

n = 862 (578 TLH and 284 SLH)

(excluding cancer or prolaps surgery)

Laparoscopic total hysterectomy

study design (2)

December 2005 to May 2008

944 hysterectomies

- TLH (Total Laparoscopic Hysterectomy)
- SLH (Subtotal Laparoscopic Hystrectomy)
- ABD (Abdominal Hysterectomy)
- VAG (Vaginal Hysterectomy)

Laparoscopic Hysterectomies

92% (TLH and SLH)

(excluding cancer or prolaps surgery)

- only simple hysterectomies (if appropriate with monolateral or bilateral surgery on adnexa e.g. ovarian cyst or adnectomy), but independent of uterus size
- preoperative, but if appropriate also initially intraoperative exclusion of hysterectomies with complicating subsidiary interventions (adhesion site, severe endometriosis, large tumours of adnexa etc.)
- following a study-independent acclimatization period, all operations were performed with one set of instruments by one and the same surgeon in as uninterrupted a sequence as possible
- if it became apparent in the course of a test series that a procedure or instrument was disadvantageous to the course of the operation, the series was discontinued on ethical grounds

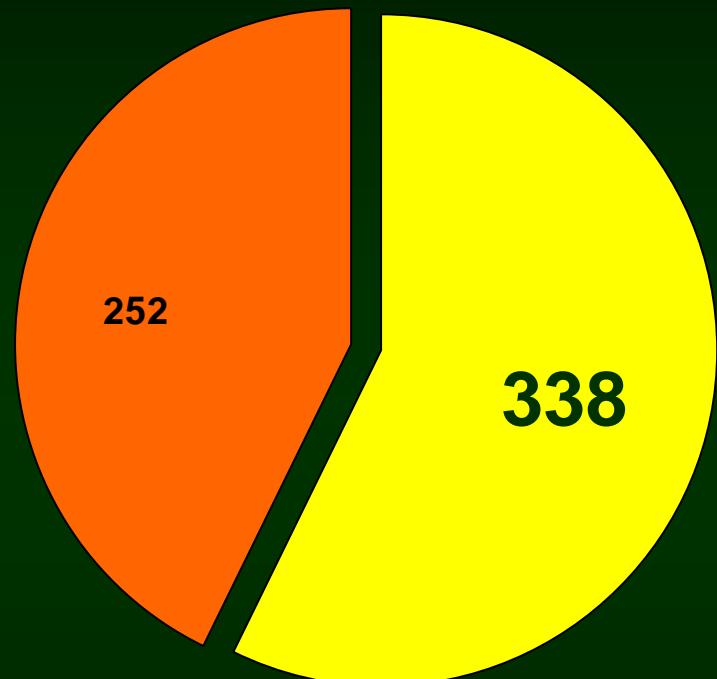

1. **Preparation:** following preoperative diagnostic hysteroscopy (obligatory at our hospital) and once positioning, disinfecting and sterile draping are complete, this phase comprises:*ingress with the Veress needle, safety checks, positioning of the 4 trocars (10 mm subumbilical, 5 mm suprasymphysial, median and bilateral), visualization of the site possibly with smaller adhesiolyses around the caeca or adnexa and preparation of the instruments for the hysterectomy itself.*
 2. **Hysterectomy:** period between detaching the adnexa from the uterus or from the infundibulum pelvicum and detaching the portio from the vagina.
 3. **Extraction:** the following procedures were used depending on uterus size: *simple vaginal extraction (102/172=58.2 %), hemisection, morcellation or myoma nucleation (33/172=19.2 %) or the use of 15 mm or 20 mm morcellators (37/172 = 21.6 %)*
 4. **Suturing of the vaginal fundus:** provide the stump of the vagina with a continuous suture using PDS 0 and subsequent central peritonealization of the central wound area above the vaginal fundus.
 5. **Finishing up:** irrigate the abdominal cavity, check that intestine and ureters are undamaged, position a 15 Robinson drain in the pouch of Douglas, retract the instruments under observation and drain the pneumoperitoneum, intracutaneous skin closure and dressings.
- = **Total operating time:** made up of all the above-mentioned individual steps together.

Laparoscopic total hysterectomy

study design (6)

December 2005 to May 2008

578 total laparoscopic hysterectomies

■ included in study

Study
n = 338 (58%)

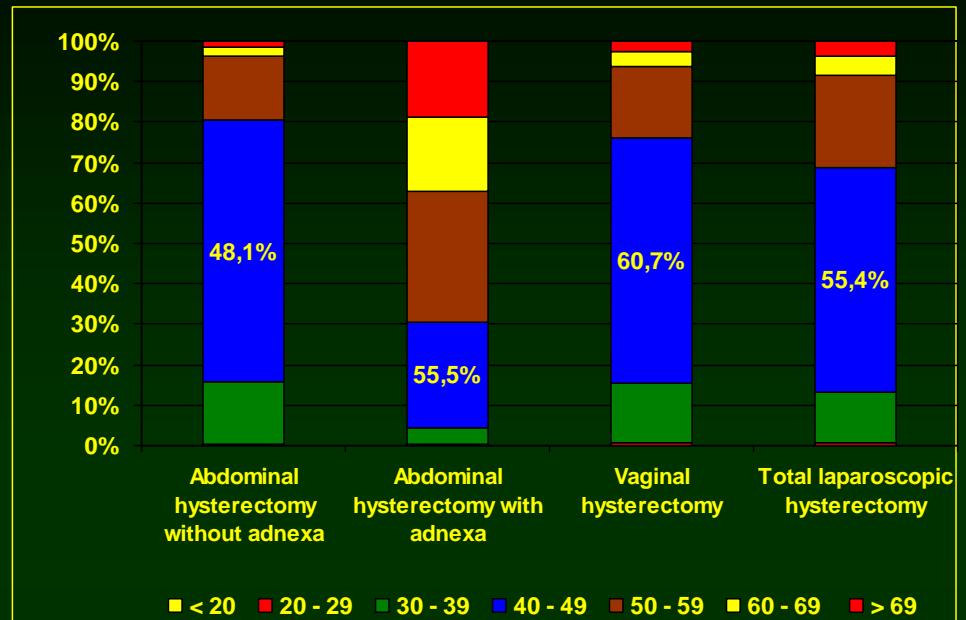

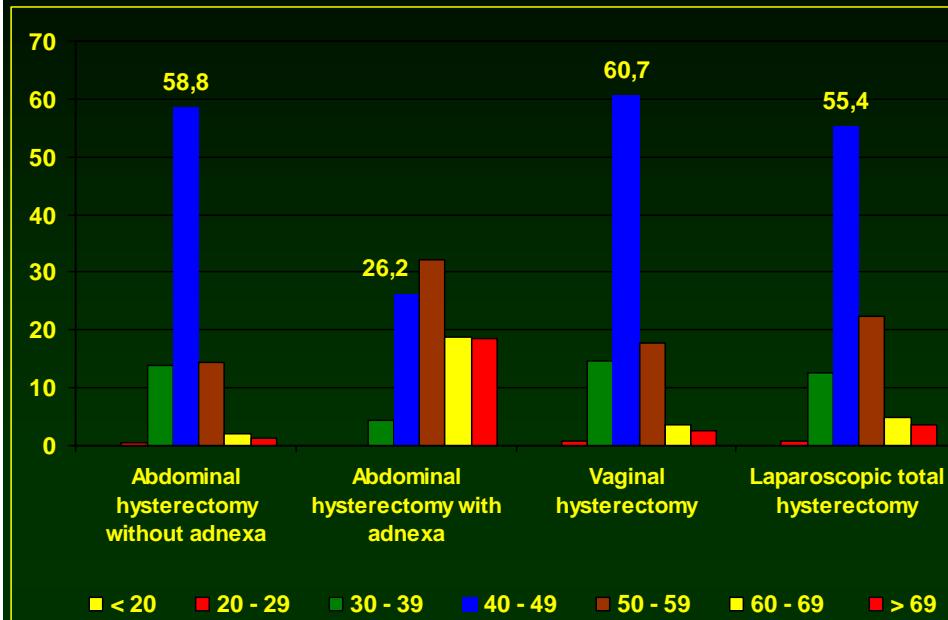

No significant differences:

| | | |
|-------------------------|--------------|-------------|
